

Grocery Delivery App

General Thought Process

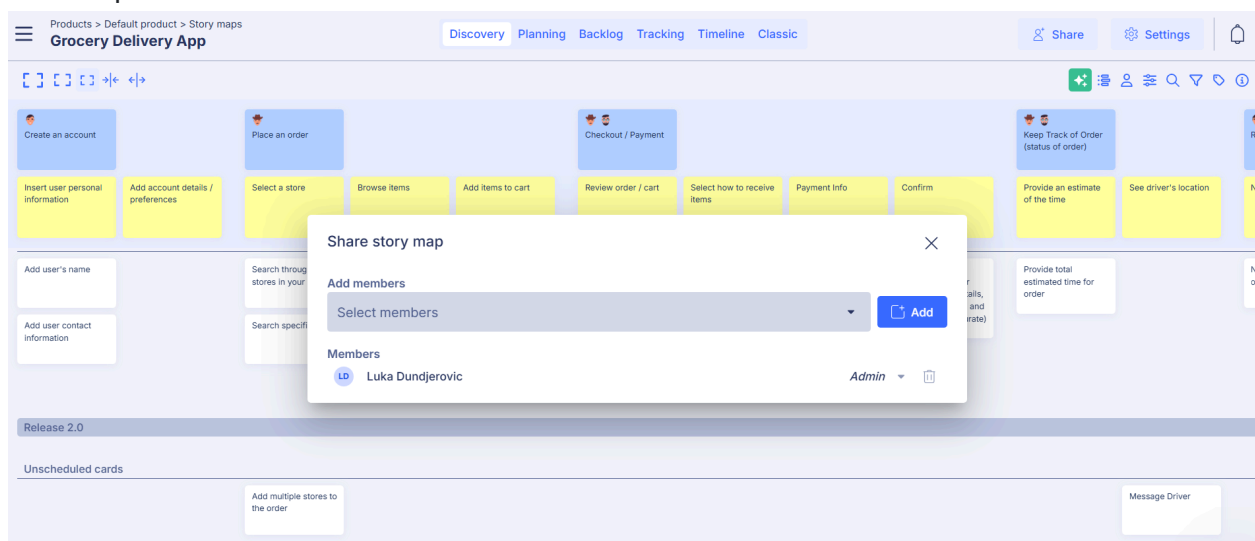

My general thought process behind the storyboard was that the most essential goals for this app would be creating an account, some way to create an order, and what happens after the order is placed (receiving it). As I started to brainstorm, I realised that the main goals could be divided further into checking out and tracking your order. Once I decided, the main goals started thinking about how to accomplish these goals with the story, and later many tasks. For the MVP, I decided that the most important features were to make an account, have a basic way to select items, confirm your order, and finally be notified when the order has reached it's destination. The second release has more advanced features like item preferences and many more. I took a lot of inspiration from the uber eats app when creating this story board.

Three Decisions Made for the Storyboard

1. Have the items initially displayed by category in the initial release. I decided to put this in the initial release because I thought that it would be very tedious if there was only a single large display of all the store's items and would lead customers away.
2. Separate the Epics keeping track of order and receiving order. I decided to separate these because I thought that they may have many different features associated with them and I felt they don't quite fit into the same category
3. I decided to pre-set user info and locations in the second release because I didn't think it was fully necessary to have a working application, although it may be tedious to enter an address or info every time you use the app.

Extra Feature Used

- The extra task that I used was the personas in order to show who is responsible for specific tasks

Detailed Task 1

Delivered to your door (person to person or not)

Checkout / Payment > Select how to receive items

Description

As a very busy entrepreneur, I want to get groceries delivered to my door, so that I can save time in my day.

Detailed Task 2

Notification when driver is near

Receive Order > Notifications for order

Description

As a *forgetful person*, I want to be notified when the driver is close, so that I don't leave my order out to go bad or get stolen.

Detailed Task 3

Insert preset payment methods

Create an account > Add account details / preferences

Description

Switch to legacy editor

As a loyal customer, I want my payment information to be remembered, so that I don't have to retype it every time.
